

vim
:q
1) normal mode
2) i/a → insert mode → esc → normal mode
2.1) A → append mode (end of the line)
:q!
3) press : → command mode → esc → normal mode
:w
u = undo
0 → beginning of the line
\$ → end of the line

Buffer like open file, and we can edit a buffer as a simple file with vim
x → delete character: it could be undo by using u
dd → delete entire line → we can paste after it this line

In normal mode:

h ← tead 0
l →
k ^
j v

:r «file_name» — this is reading of a file and adding it in current file
:w «file_name» - this is to save changes in another file instead of current → :q!

Linux commands from vim:

:! <command>

Buffer is a holding area for text

:e «file_name» - open a new buffer
:bn = buffer next
:bp = buffer previous
:bp or :bn have circle direction

:enew = new empty buffer (also support :bn and :bp)

In classic vim after creating new buffer and making changes in it we cannot switch to another buffer before saving hovever in neovim it is possible.

4) v → visual mode: highlighting of text
y → copy highlighted text (yank)
p → paste (in normal mode)

visual mode → esc → normal mode

from visual mode: : → command mode → sort ui → it sort in alphabet order and removes duplications. So we can switch to command mode exaxtly from visual mode

:2 → move to line 2

:%s/find_goal/replace_value/g

without /g the replacement will be executed only once in one line, but with /g all matches will be changed

gg — to the beginning of the file

G — to the end of the file

:redo / :red / g+ / g- отмена

:undolist — список всех состояний до отмены

:earlier 10m — вернуться к состоянию 10 минут назад

:later 10s — перейти на 10т минут вперёд

:bd — buffer delete

:split OR :sp «file_name» - open files concurrently in one window

Ctrl + ww — to switch between the files.

:vsplit OR :vsp OR :vs — vertical :split OR :sp

:set (no)number — add or remove numbers of lines

vim +20 <file>

:badd <file> - add new buffer but not switch to it

:split

vim <file_1> <file_2> → :bn/:bp

vim -o <file_1> <file_2> - in one window

vim -O <file_1> <file_2> - in one window vertically
